Spiekkaart · Purser · Demo Day

De hoofdrun, 3 november 2026, testgeld. Volgorde: hook → wie/wat → run op /watch (3 scènes, géén disclaimers) → "Said plainly" + /proof → kernzin → tamper → einde. Draaiboek: `docs/submission/demo-day.md`.

OPENING (LETTERLIJK)

> **AI agents are starting to spend money. So who signs off? I'm Max Geurtsen, and this is Purser.**

WAT ALLEEN PURSER HEEFT (LETTERLIJK, JURY REVIEW 6 NOV)

An approval is usually a button. In Purser it's a signature over the exact terms: change one cent and it's worthless. · One CFO policy, a lock per rail: Airwallex card controls, Metal's mandate, the CFO's signature on invoices. A prompt is not a control. · Real agents: Claude made all 24 decisions (routine payments are code); no key reaches Claude. · Try it in a minute. · The Kit 11 scenario, run live on 3 November.

ROND 0:25 (LETTERLIJK)

> **Inside its limits an agent pays alone; beyond them, the CFO signs. In this demo, I play the CFO.**

SLOT (LETTERLIJK)

> **Claude explains and proposes, the rules in code hold every limit, and a person signs before money moves beyond them. On mine, signed before, I change the amount by one cent. The same signature is refused. One cent. Worthless.**

DRIE GETALLEN (ALLEEN DEZE)

16 stops

16 stops, nothing paid over a limit: one buy rule Claude set stopped 12 overpriced checks, Metal refused 2 purchases, the CFO rejected 1 proposal, and 1 planted instruction changed nothing. (Metal: #24, #37; CFO: P-0004)

6 s

6 seconds from Face ID to PAID; de settlement is gesimuleerd in de sandbox

5

5 Face ID decisions door jou (+1 co-signature; P-0001, P-0002, P-0004, P-0005, P-0006)

Verder: 24 of 24 decisions by Claude, 0 fallbacks · #24: "We switched off our own check once to prove the chain holds the line." "Metal refused it; the refusal is recorded on chain." · De 12: Claude zette de regel, code paste hem toe · Optie A: cap 0.04, prijs blijft 0.05 · optie B: zelfde cap, prijs 0.07 (binnen dezelfde 20.00) · EUR 110.00 via FX, alleen het tekort · 412 audit rows.

URL'S

Jury tekent	**kit11.max-31b.workers.dev/try/sign** (QR rechtsboven, deck slide 5)
De run	kit11.max-31b.workers.dev/watch?scene=1 · chips 2 en 3
Bewijs	kit11.max-31b.workers.dev/proof · terminal: `npm run verify`
Reserve	`npm run judge` → localhost:4311/watch, /proof

PLAN B, PER STAP

Site traag/weg	`npm run judge` offline, dezelfde pagina's op localhost:4311.
/watch hapert	Clip uit `out/video/clips/`: 05-price, 07-dispute, 09-six.
QR of /try/sign faalt	Tamper zelf op je vooraf getekende tab; anders clips 11-turn en 12-tamper. QR staat ook op slide 10: "try it during the questions".
Face ID weigert	Nog één keer; dan clip 08-faceid: "Same moment, recorded."
Geluid/scherm weg	Deck-PDF in de chat; praat over de slides, alle getallen staan erop.
Tijd ingekort	De 30-secondenversie (pitch.md, §1), dan de QR-slide.

TOP-5 Q&A (DOCS/SUBMISSION/QA.MD)

1. **Why Face ID, not a password?** A password is the same for every payment; a passkey signs the hash of these exact terms, so one cent more makes it worthless.
2. **What was live, what simulated?** Live: Airwallex sandbox, Metal testnet, 24 of 24 Claude decisions, Max's passkey (Face ID on his phone). Simulated: supplier, customer, merchant, SWIFT SENT/PAID, and the second approver, a labelled test passkey.
3. **Why three models?** Honestly, Haiku alone passed our everyday cases too; on a harder dispute it misread one order, so Sonnet reads documents. Opus is the least proven part.
4. **Server compromised?** The rails refuse anything over their current limits; changing a limit needs a signed proposal. A compromised runner host is out of scope today; keys go to a KMS first.
5. **Can the jury's passkey touch the real CFO?** No: the test world and its passkey live in their own store and are enrolled nowhere else.

EERLIJK, ALS ZE DOORVRAGEN

"T:0: 95 journal entries posted to T:0's shared sandbox entity on 10 Nov (first je_prod_z7kTCuZ1iiwad01q); debits equal credits, and T:0 matches our books line by line." Tweede push: 0 nieuw; T:0's eigen balans klopt. · Twee sloten (10 nov): test-passkey tekende, Airwallex hield de betaling `IN_APPROVAL`; niet goedgekeurd in de web-app, dus niet betaald. · Cardputer: built, not yet live. · Tweede goedkeurder: een gelabelde test-passkey, ingedrukt door Claude Code op jouw go. · Metal: 86 payments, each its own transaction, plus 6 mandate transactions and the refusal of #24, on chain, checkable; no clearing in this run. Airwallex-id's: "published". · Nooit: "code decides", "safe", "Finalist", "Shortlisted".
