Kit 11 · x402 Business Agents · entered for the Metal Award + Visa Award

Purser

Claude explains and proposes, the rules in code hold every limit, and a person signs before money moves beyond them.

24/24
decisions by Claude, 0 fallbacks

2
stopped at a limit (1 by Metal, 1 by the CFO)

5
Face ID decisions by the CFO

6 s
from Face ID to PAID; the settlement is simulated in the sandbox

One live run, 3 November 2026: Metal testnet and the Airwallex sandbox, test money only.

Airwallex Metal with Claude

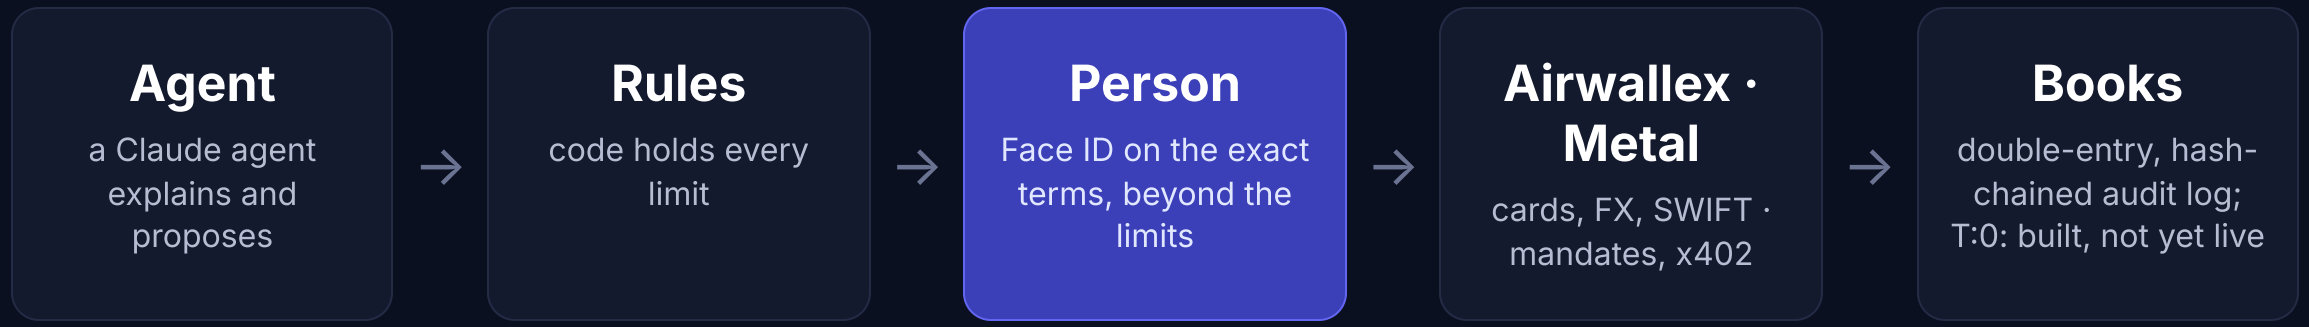

The problem

AI agents can now spend money. So who holds the pen?

- An agent pays as fast as it is told to, also by a fake invoice.
- A limit written in a prompt can be talked out of.
- The limit has to live in the rails and in code, with a person above it.

How it works

Each agent its own card and its own mandate

Northwind Outdoor, an outdoor wholesaler that sells live stock data to retailers per query. Three agents (Sourcing, Support, Treasury), 20.00 test USD between them.

The main run, 3 November 2026 · replay on /watch

One live run, three beats

1 · The price rise

Metal refused it.

Stockline went from 0.02 to 0.04 a stock check, over the 0.03 cap. One purchase was let through on purpose; Metal refused it on chain (tx `0x2e92f9cb…1871`). Treasury's options came 40 s later; the CFO signed with Face ID (1 of 2), a labelled test passkey signed 2 of 2.

2 · The dispute

9 refunds rejected.

A simulated customer disputes 12 orders, saying its agent never placed them. Every order carries its agent's signature, so that claim fails. Three orders had wrong data; the Support agent refunds those 3 (0.15 test USD) itself. "Refund the other 9" goes to the CFO, who rejects it with Face ID.

3 · The euro bill

PAID 6 s after Face ID.

The Treasury agent planned the EUR 240.00 licence itself. After the CFO's Face ID: EUR 110.00 bought by FX for only the shortfall, then SWIFT, fee EUR 13.42. PAID in the sandbox, where the settlement is simulated.

Try it yourself

Sign one yourself

kit11.max-31b.workers.dev/try/sign

A test world of your own. A rule blocks one payment; you sign the other with your passkey.

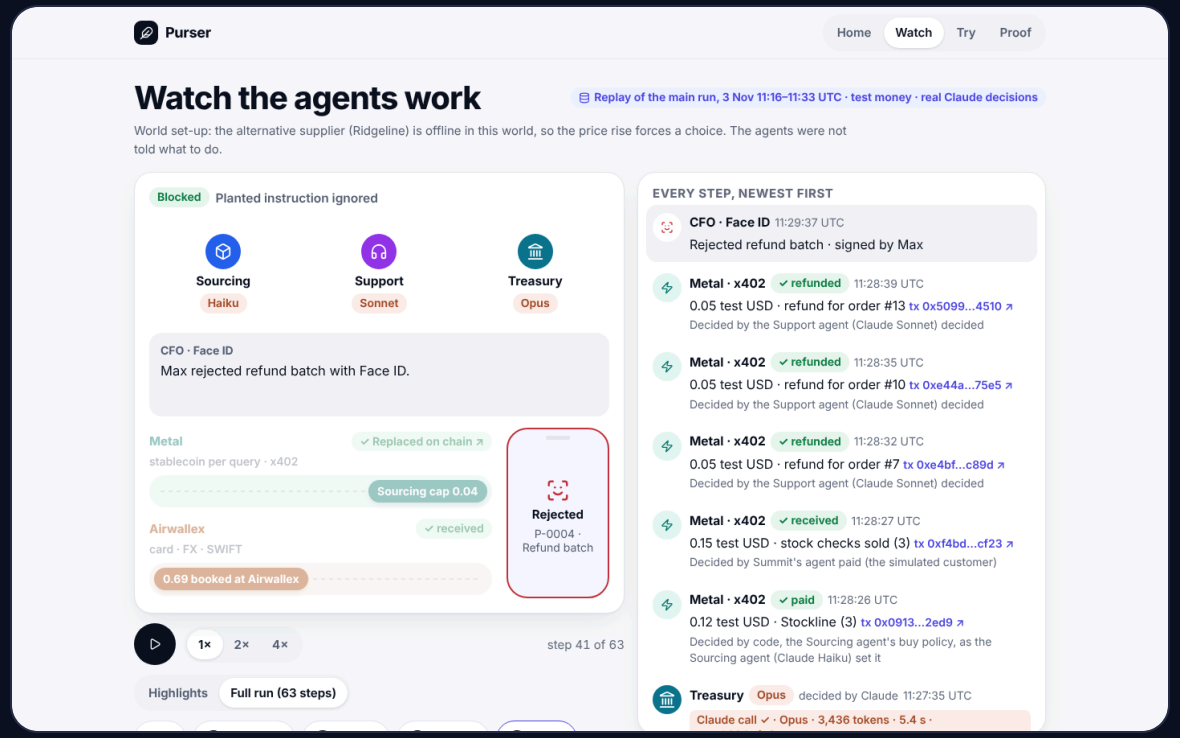

Change one cent, and the same signature is refused.

Test world · test passkey · nothing real moves.

Proof

Every id is public

- **2 stopped at a limit** (1 by Metal, 1 by the CFO). Metal's refusal: `0x2e92f9cb…1871`
- Mandates replaced on chain: `0x789abb24…ebbc`, `0x2a91ac97…e790`
- Refunds #7, #10, #13 on chain; sweep `0x86936a5b…ccb4`, deposit `b3812e05…e0a0`
- FX `3ca88196…4636`; SWIFT transfer `03360bfa…3985`
- Card raise P-0006, EUR 30.00 → 46.00; Airwallex authorization `01a1a12f…0007`
- 412 audit rows, hash-chained: `npm run verify`

The main run, 3 November (/watch): #7, #10, #13 refunded, each on chain; "refund the other 9" rejected by Max with Face ID

> Airwallex declined EUR 45.00 over the card limit (LIMIT_EXCEEDED), separate TAP run, 2 November; **not counted above**.

Said plainly

What is real, and what is not

Real, with test money

- The Airwallex sandbox: cards, FX, SWIFT, the deposit.
- On Metal testnet, checked against the chain on 5 November: the 4 mandates bound at setup that morning and the 2 replacements; 86 test-USD payments, each its own transaction (41 sales, 41 supplier purchases, 3 refunds, 1 sweep); 1 refusal recorded on chain (#24). No emulator and no clearing in this run. Not on Metal: the EUR licence (FX, SWIFT) and the card buy, on the Airwallex sandbox; the other 13 refusals (12 by the Sourcing agent's buy policy, #37 by Metal during the replace) are in the ledger, not on chain.
- Claude: 24 of 24 decisions, each with its request id.
- The CFO's Face ID, on his own phone.

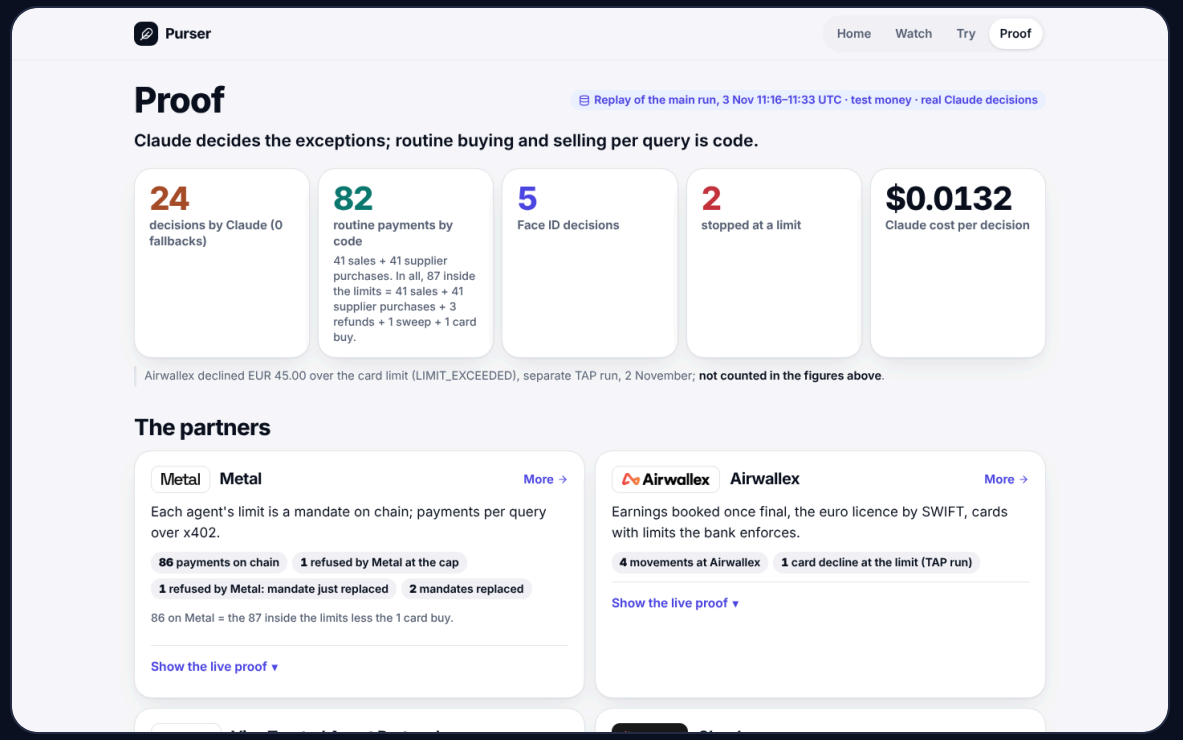

Ours, simulated or not yet live

- The supplier, the customer and the TAP merchant are run by us.
- SWIFT SENT and PAID: moved by Purser through Airwallex's sandbox simulation API.
- The second approver: a labelled virtual test passkey, pressed by our build tool (Claude Code) on Max's go.
- Built, not yet live: the Cardputer hub.
- Built, not yet live: the T:0 books sink (nothing posted: the shared sandbox key could not post, 403 CAPI71; on 5 November T:0 refused its new read-write key, 401 CAPI11).
- Red team on stand-ins: 37 of 39 attacks stopped, 2 more detected afterwards, not prevented.

Claude, measured

Claude explains and proposes

- 24 of 24 decisions by Claude, 0 fallbacks, 50 calls, USD 0.3170 at list prices.
- Sourcing on Haiku, Support on Sonnet, Treasury on Opus.
- Our benchmark: Haiku alone is as good on everyday cases, and misread one harder dispute.
- Claude holds no key and approves nothing; code checks each proposal first.

Proof: who decided what in the main run, each with its proof

Business model (plan) and roadmap

A monthly fee per active agent

- Priced per company and per active agent; no cut of payments.
- First customers: small cross-border companies on Airwallex that run AI agents.

Now

Airwallex sandbox · Metal testnet · one company per ledger

Next

keys in a KMS · Postgres · a pager on /health · many companies

Then

Metal mainnet · four eyes by default · more Airwallex rails

Purser · Starter Kit 11
